Penobscot Narrows Bridge and Observatory - Wikipedia

A cable-stayed bridge has one or more towers (or pylons), from which cables support the bridge deck. A distinctive feature are the cables or stays, which run directly from the tower to the deck, normally forming a fan-like pattern or a series of parallel lines. This is in contrast to the modern suspension bridge, where the cables supporting the deck are suspended vertically from the main cable ...

The earliest known and still intact 'true' cable-stayed bridge is the Buff Dale Bridge in Texas, built way back in 1890. In recent times, thanks largely to computer aided designs (CAD) and improvement in the quality of materials used in their construction, cable-stayed bridges have become a very popular, and not to mention economical method of building medium- to large-span bridges.

Cable-stayed bridges can also use four arrangements for their support columns. One of the most common design options for a cable-stayed bridge is called the "single arrangement." This option uses on column for cable support, usually through a projection in the center of the deck. It can also be placed along one of the sides of the structure.
