Cardiology And Cardiac Catheterisation The

During cardiac catheterization, a long thin tube called a catheter is inserted in an artery or vein in your groin, neck or arm and threaded through your blood vessels to your heart. Using this catheter, doctors can then do diagnostic tests as part of a cardiac catheterization. Some heart disease treatments, such as coronary angioplasty and coronary stenting, also are done using cardiac catheterization.

Cardiac catheterisation is an invasive diagnostic procedure that provides important information about the structure and function of the heart. It usually involves taking X-rays of the heart's arteries (coronary arteries) using a technique called coronary angiography or arteriography. The resulting images are known as coronary angiograms or arteriograms.

take a close look at the heart to identify problems and perform other tests or procedures on your heart.

Cardiac Catheterization | NHLBI, NIH

A cardiac catheterization is a minimally invasive diagnostic test, performed through a small incision. We use this test, along with an angiogram, to detect blockages in the arteries of the heart and diagnose heart disease and heart attack. How is catheterization done? Experts will administer medication through an IV to help you relax.
