Since all Raw Minerals have higher heat conductivity than all commonly piped Resources, using Wolframite or Granite over Sandstone will not result in faster heat transfer from the piped resources to the surroundings of the pipe. One might think that pipes with higher conductivities would exchange heat better between pipe segments, but as of AU ...

In one tick, the heat transfer should be: . With a specific heat capacity of 0.386 (DTU/g)/°C, that would be enough to raise/lower the temperature on each side by , which is well over the 25 degrees needed to equalize the temperatures. However, the total heat of the first cell is , and the 2nd is , so the maximum heat transfer is clamped to .
