Vrf Lite For Dell Networking

Published February 2016. VRF Lite is VRF deployment without MPLS. There are several benefits to implementing VRF lite. The ability to configure multiple VRs in a single switch/router reduces physical equipment required, creating a sizable cost advantage. VRs also allow more efficient updates by requiring upgrades to only a single switch/router instead of several.

This guide demonstrates multitenancy via VRF-lite on supported Dell Networking switches (S4810, S4820T, S5000, S6000, Z9500). Virtual Routing and Forwarding (VRF) allows a physical router to be partitioned into multiple Virtual Routers (VRs). The control and data plane are isolated in each VR so that traffic does not flow across VRs, thus allowing for multiple different routing tables to co-exist within the same physical L3 switch/router at the same time.

See theDell Networking: Multitenancy Across Physical and Logical Environments with VRF-lite and VMware NSX white paper. [] The VRF-lite feature is supported with Dell's Virtual Link Trunking (VLT) multipathing technology. [] The VRF IDs of virtual routers running on a given physical switch are not exchanged with virtual routers running on other physical switches.

Virtual Routing and Forwarding (VRF) allows multiple instances of a routing table to co-exist within the same router at the same time. DELL OS 9.7 supports up 64 VRF instances. Number of instances can be increased in future versions therefore check current documentation for authoritative number of instances.

Intro to VRF lite By stretch | Thursday, April 30, 2009 at 3:08 a.m. UTC VRFs, or VPN Routing and Forwarding instances, are most commonly associated with MPLS service providers. In such networks, MPLS encapsulation is used to isolate individual customers' traffic and an independent routing table (VRF) is maintained for each customer.

Intro to VRF lite - PacketLife.net

VRF-lite is a feature that enables a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. VRF-lite uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF.
